

Natural Gas Facts

Finding efficient renewable resources to manage the services we provide is part of our daily effort at RPM Consolidated Services. Whether it takes the shape of managing how fuel byproducts are introduced into our environment, more efficient lighting resources, recycling programs or community awareness, it is the responsibility we all share and must commit ourselves to. One of the largest commitments we've made is towards Natural Gas Technology; specifically how it can be used to manage a more sustainable path towards our future.

With regard to this technology, here are some of the key factors contributing to why we are so dedicated to these efforts:

- Lower cost & cleaner diesel alternative, not just in California
- Approximately 98% of natural gas consumed in North America is domestically produced
- By the numbers.....

Natural Gas compared to oil combustion produces:

- 30% less carbon dioxide
- 90% less particulate matter
- 90% - 97% less carbon monoxide
- 35% - 60% less nitrogen dioxide
- 50% - 75% less non-methane hydrocarbon
- "Zero" emissions
- Clean air compliant
- Natural gas is nontoxic and disperses quickly
- Natural gas engine noise can be reduced by as much as 50% compared to diesel engines

Sustainable methods applied to how we conduct our business today protect the environment for tomorrow. RPM Consolidated Services Inc is proud to be a part of this effort and we look forward to the benefits we can all share with future generations.
